

Computer Network

ASSIGNMENT – 11

Design Documentation

DEVELOPMENT OF NEW MODULE FOR
NS2 (ARQ SUPPORT)

HARSHIT KUMAR GUPTA

ENTRY No. 2013EET2369

Contents

1	Problem Statement	2
2	Assumptions :	2
3	Specifications	3
4	Approach :	3
5	Execution	4
6	Conclusion	5
7	Implementation :	6

1 Problem Statement

- We first design NS2 modules for limited persistence ARQ protocol (sample codes will be provided)
- feedback channel is assumed to be error free
- setup an experiment to show the impact of ARQ module on TCP throughput. Insert an error module with error prob. (make a Tcl simulation script)
- make a folder in `/ns-allinone-xxx/ns-xxx/yourfolder` and copy .c and .h files in this
- 2 copy ns-lib.tcl and ns-link.tcl at their places
- recompile complete ns2 and generate object file
- make tcl simulation script to test your module
- make an error model and set its error rate from the argument passed while running the script
- use link-lossmodel between n1 and n3
- use command link-arq defined in ns-lib.tcl with proper args
- make tcp connection between n1 and n3

2 Assumptions :

Assumptions made are:

- Only two link's are able to send packet at a time.
- The communication can be only between two distinct link's.
- The pkt drop according to the arq model or rate.
- The communication between two nodes are only for 100.1s .

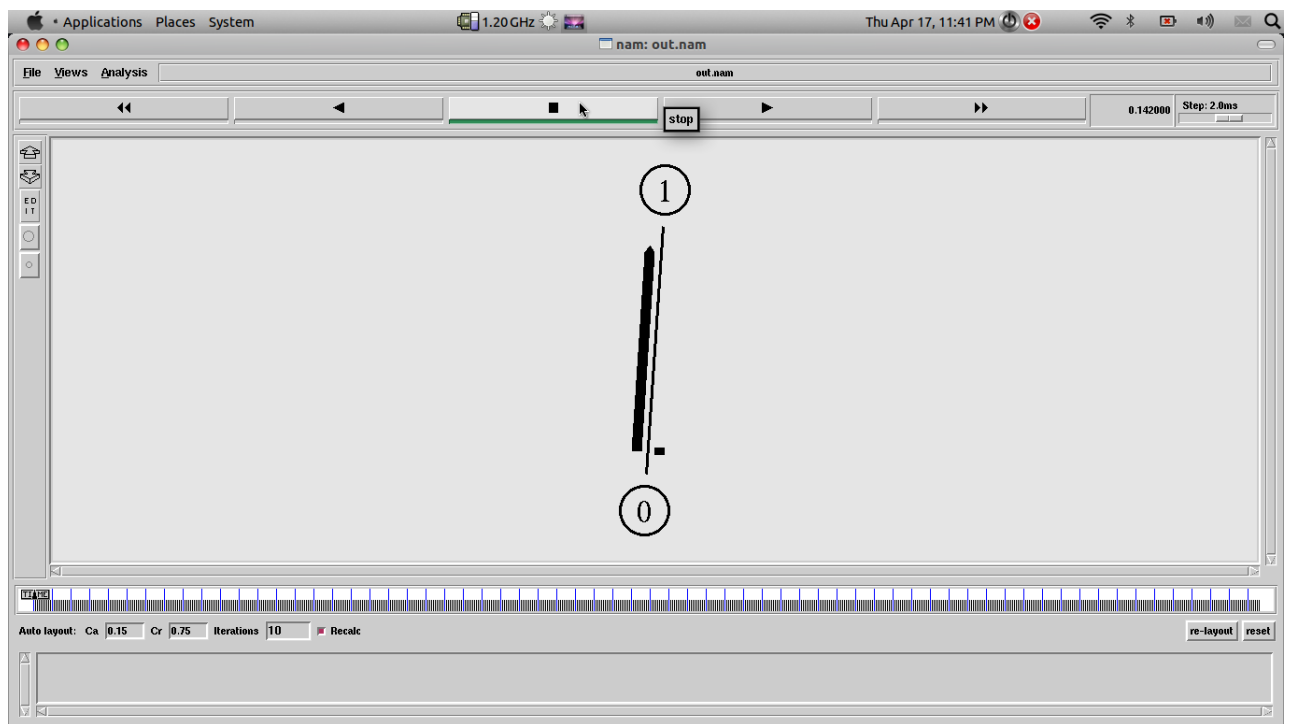

3 Specifications

The following specifications are used in the assignment:

- The link b/w nodes are duplex.
- The arq model is work perfectly.
- The pkt is drop according to given condition.

4 Approach :

1. First write a network topology using tcl. Here the connections, source and sink are defined.
2. Sample simulation can be seen using nam.
3. then add the arq model in that script.
4. On the terminal type ns [filename].tcl.
5. It will generate a trace file which contains the details of packet movement through the network.
6. Now write a awk script to parse the trace file can calculate throughput and interarrival time.
7. Write another file using the awk script which contains columns for x and y-axis for the plot.
8. On the terminal type awk -f [filename].awk [tracefile].
9. Use this output file to generate plot. For this, type gnuplot. On the shell, type plot [filename].
10. Analyse the results.

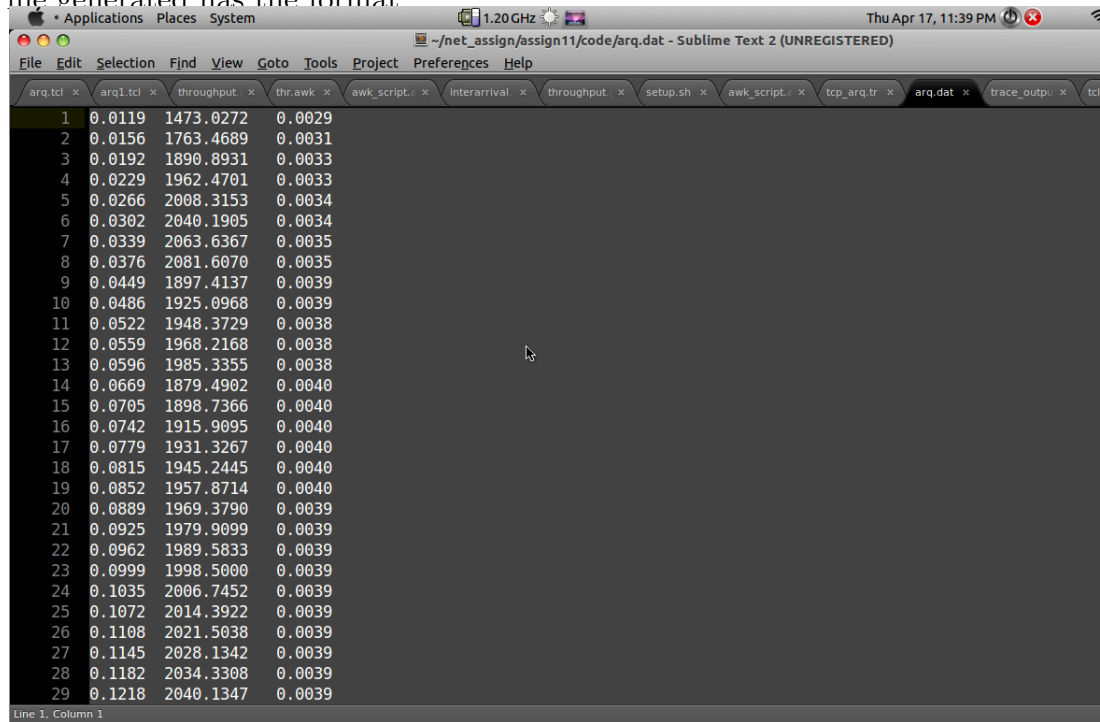

6 Conclusion

- The topology has been made using tcl.
- The throughput has been calculated.
- The graph for inter arrival time vs sequence number has been plotted.
- We observe that the throughput is upper bounded by Minimum of link capacity and sending rate.
- In case of TCP, it automatically adapts its rate based on the congestion.

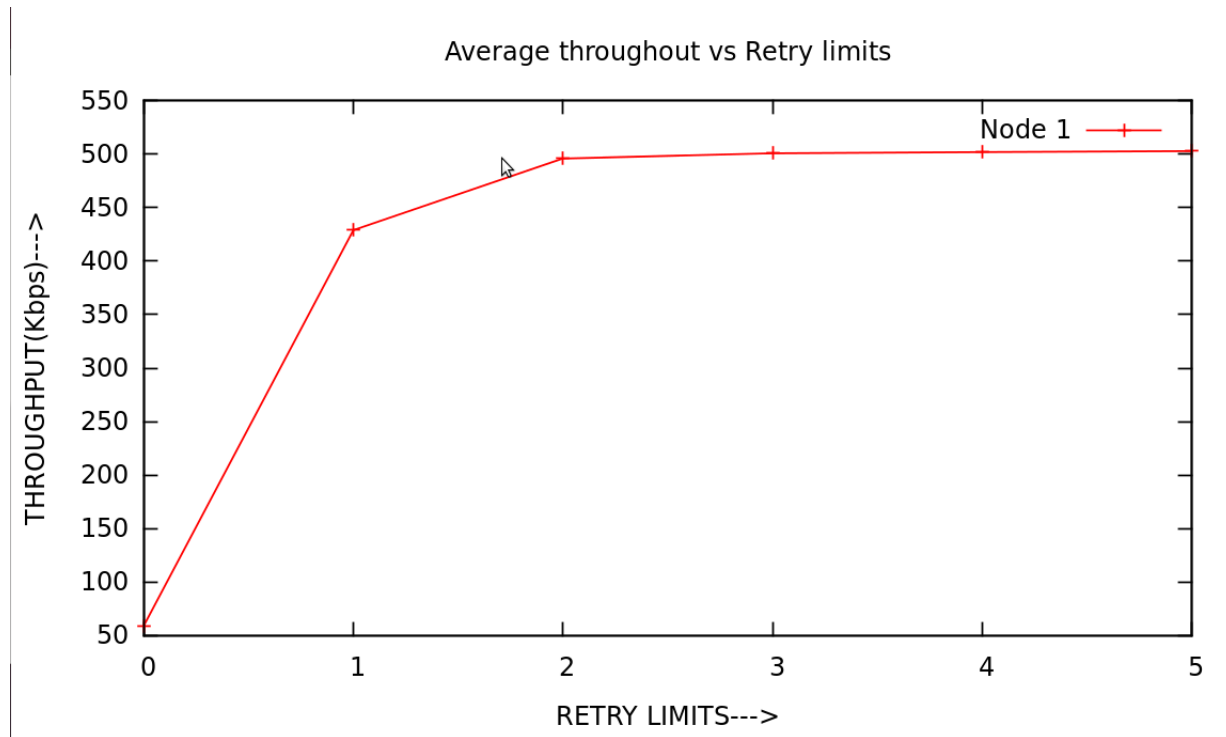

7 Implementation :

- The trace file generated has the format :

1	0.0119	1473.0272	0.0029
2	0.0156	1763.4689	0.0031
3	0.0192	1890.8931	0.0033

29	0.1218	2040.1347	0.0039

- Plot the graph between retry limits and throughput.

- Plot the graph of Throughput.

- Plot the graph of Interarrival Time.
